**Section:** Ground-Water Flow

**Page:**

**Comment:**

The potentiometric surface generated for the carbonate-rock aquifer is not acceptable. Apparently, there are not enough well data available to generate the contour. Some contours were generated based on well data across different valleys and thus they are across mountains.

**Section:** Volume of Water Stored in Aquifers

**Page:**

**Comment:**

It is so strange the way the stored water was calculated. It appears that it was tried to calculate how much water can be yielded from a 100-foot lowering of water level from the thick basin-fill aquifer and another confined aquifer beneath the basin-fill aquifer. It is not clear if the water from the confined aquifer represents the water yield from the carbonate-rock aquifer. If it is, that means that the extent of the carbonate-rock aquifer is the same as the basin-fill aquifer. This is contradictory with the presentation of the potentiometric surface map for the carbonate-rock aquifer.
